

This is to illustrate how to

1. create a MFC project
2. add member variable
3. add member function
4. add event handler

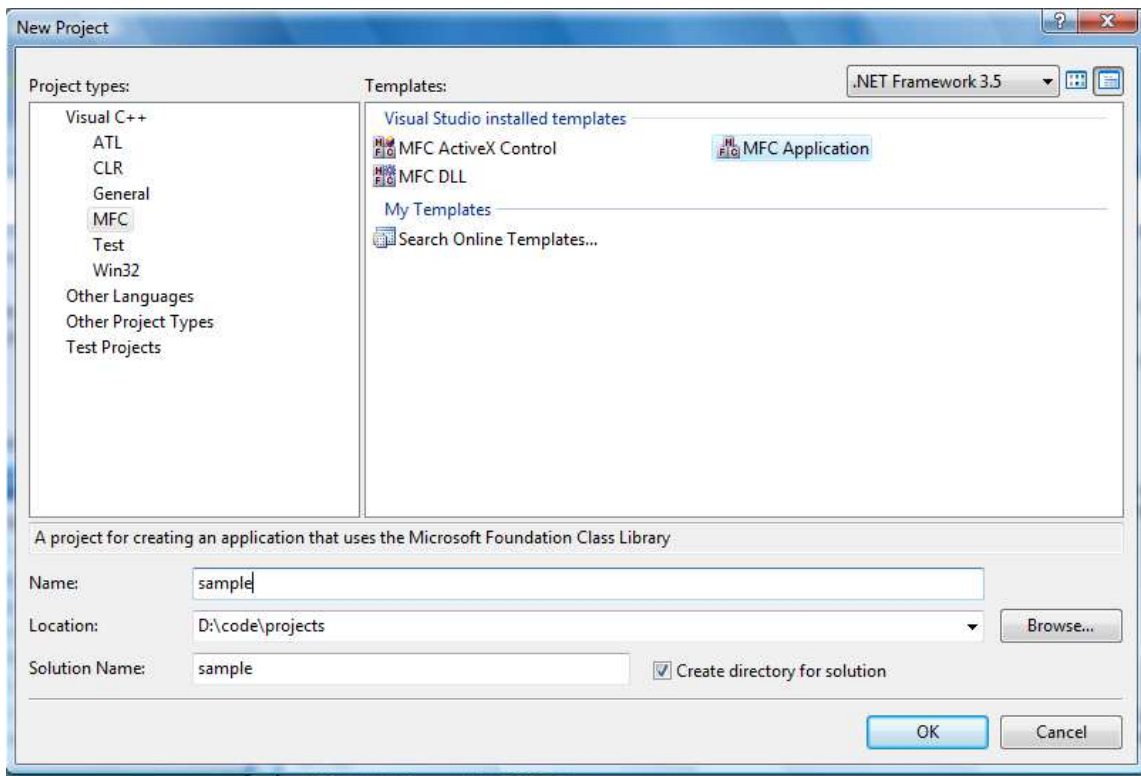

1. Create a project

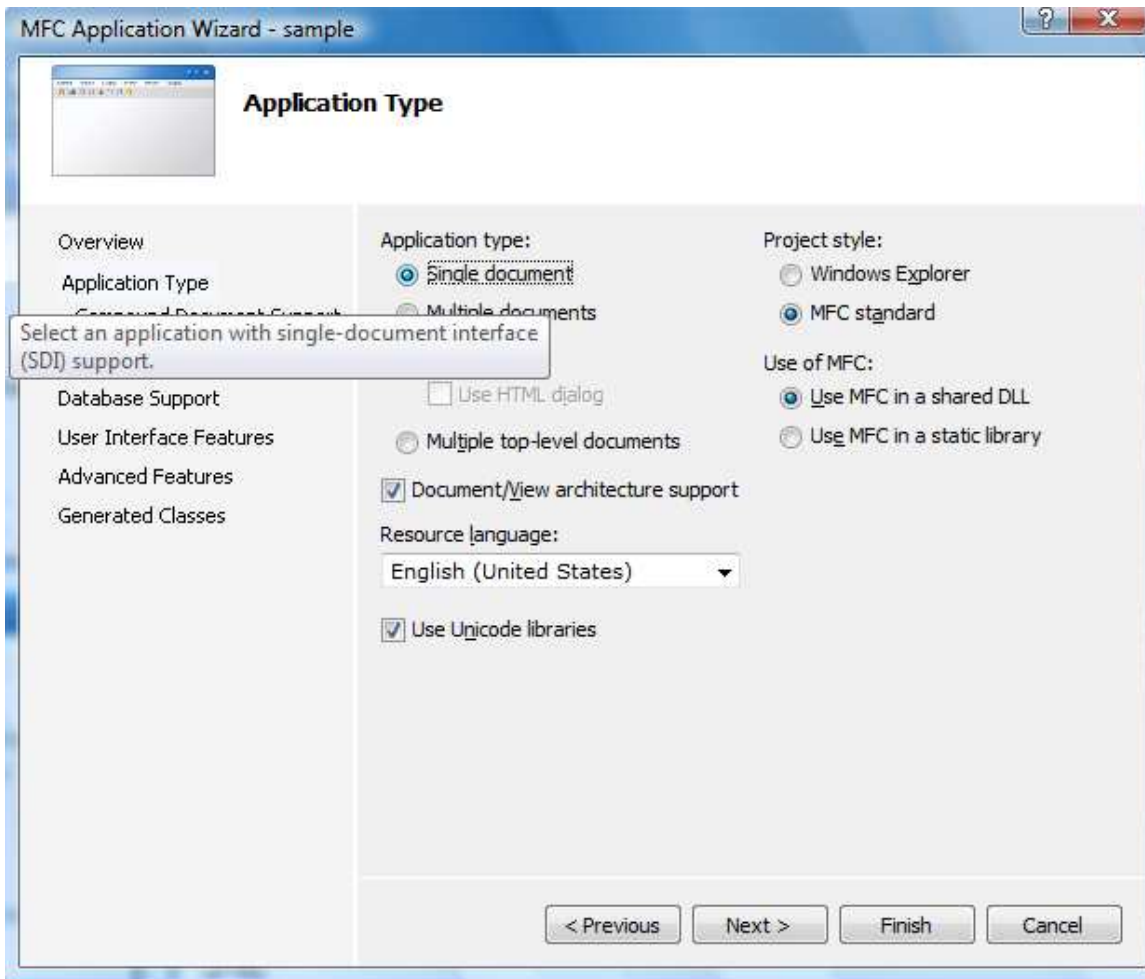

File->New->Project

In new project wizard:

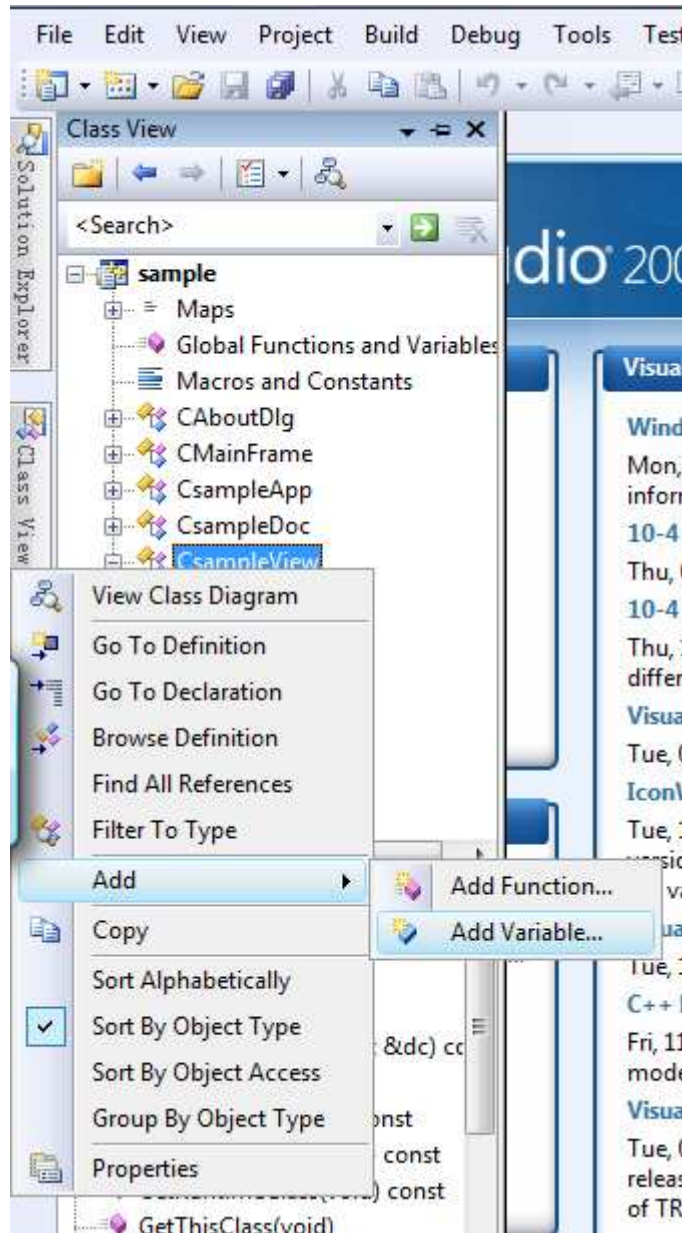

MFC->MFC Application->project name&path->next->single document->finish

2. Add member variable

In Class View, right click on the class you want add member variable(usually *View):

Add Member Variable Wizard - sample

Welcome to the Add Member Variable Wizard

Access:
public Control variable

Variable type: CPoint

Control ID:

Category: Control

Variable name: m_pt

Control type:

Max chars:

Min value:

Max value:

.h file: ...

.cpp file: ...

Comment (// notation not required):

Finish Cancel

3. Add member function

Add Member Function Wizard - sample

Welcome to the Add Member Function Wizard

Return type: Function name:

Parameter type: Parameter name: Parameter list:

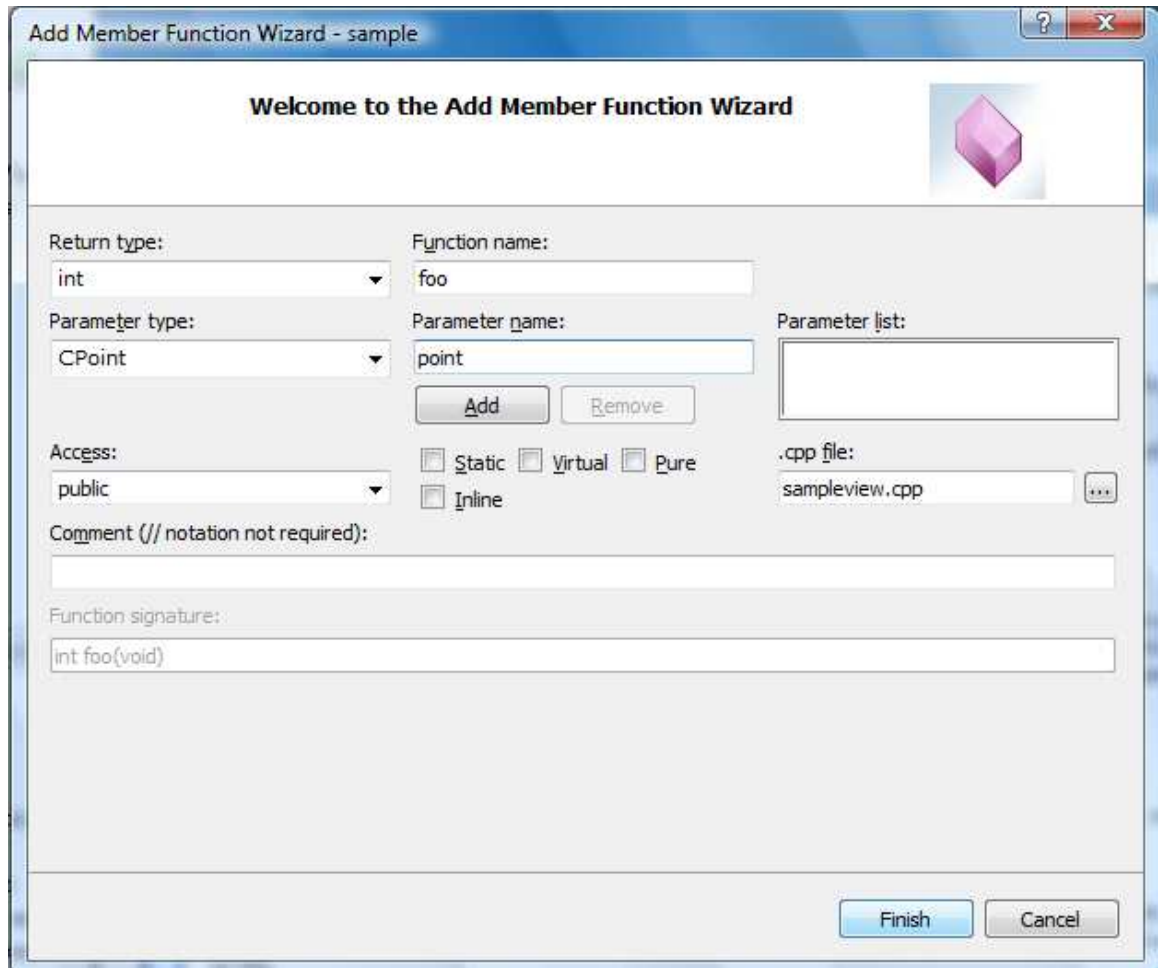

Access: Static Virtual Pure Inline

.cpp file:

Comment (// notation not required):

Function signature:

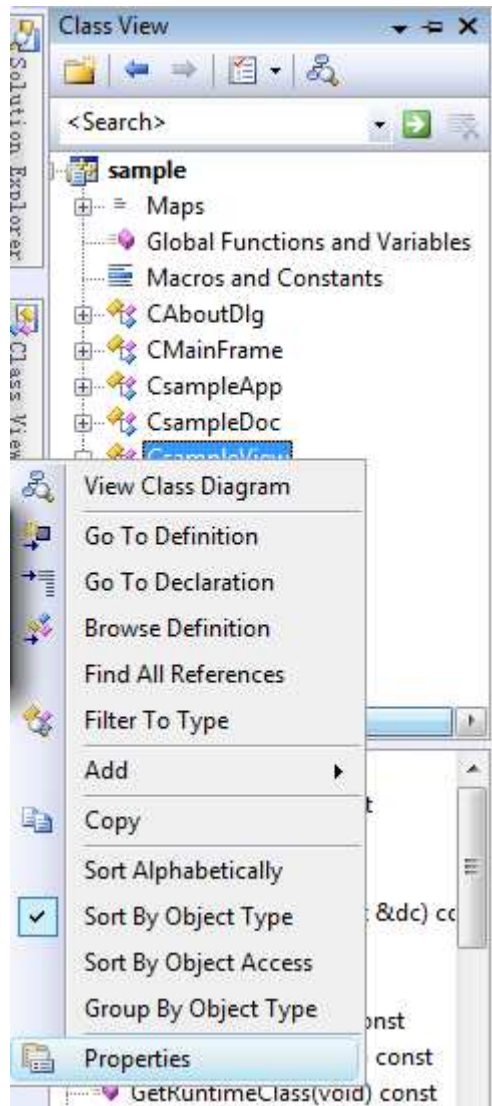

Finish **Cancel**

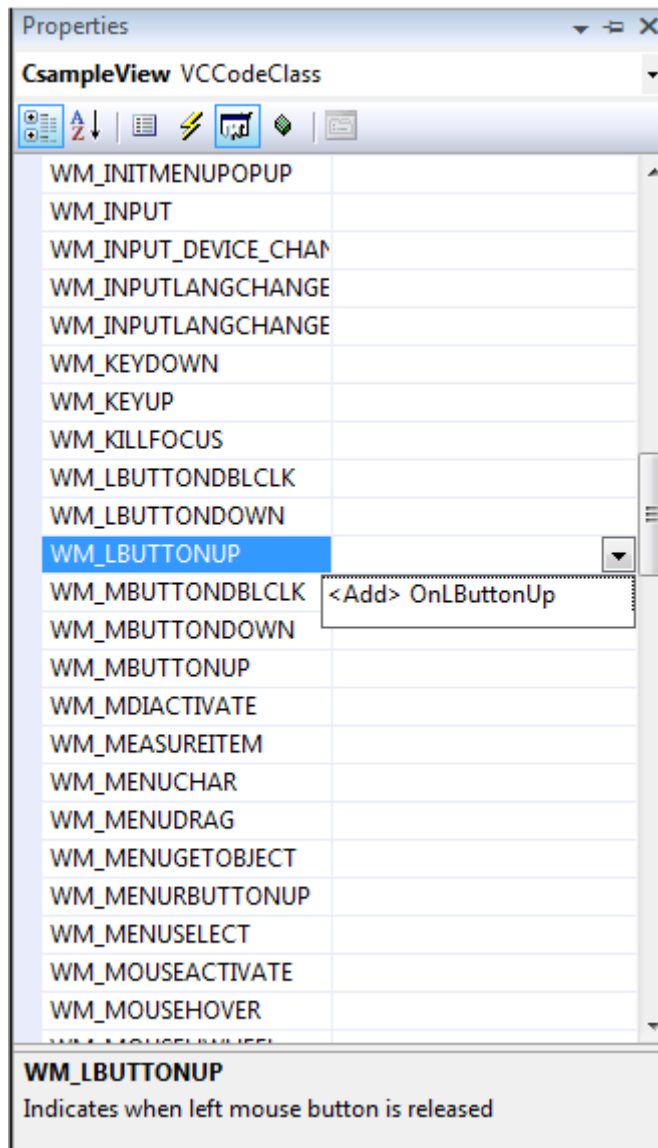

4. Add event handler

In class view, right click the class:

Property->Message->choose the one you want handle

```
void CsampleView::OnLButtonUp(UINT nFlags, CPoint point)
{
    // TODO: Add your message handler code here and/or call default
    CView::OnLButtonUp(nFlags, point);
}
```
